

ABSTRACT OF THE DISCLOSURE

A computer method for testing a test unit that includes receiving an output of the test unit into a testing system, providing an expert system operably connected to the testing system, comparing, in the expert system, the output with an expected result for the output, and determining, in the testing system, if the output complies with the expected result. A system for testing a test unit includes a testing module for receiving an output of the test unit, and an expert system for comparing the output with an expected result for the output and for determining if the output complies with the expected result.
